

```
equalsOp< doris::vectorized  
::Float64, doris::vectorized  
::UInt128 >
```

```
graph LR; A["equalsOp< doris::vectorized<br>::Float64, doris::vectorized<br>::UInt128 >"] --> B["equalsOp"]; B --> C["equalsOpTmpl"]
```

The diagram illustrates the process of template specialization. It starts with a generic template `equalsOp` on the left, which is specialized for the `doris::vectorized::Float64` and `doris::vectorized::UInt128` types. This specialization leads to a more specific `equalsOp` implementation in the middle, which then points to the final `equalsOpTmpl` implementation on the right.

`equalsOp`

`equalsOpTmpl`
